

Performance Comparison of Cached vs. Non-Cached Beneficiary Retrieval in Laravel

For each test:

1. Navigated to UI buttons in the app (Fetch With Cache / No Cache)
2. Clicked each button and recorded:
 - First-time fetch (no cache)
 - Subsequent fetch (cache hit)
3. Measured execution time (in seconds)
4. Repeated across several intervals

Also tested cache invalidation by triggering a PUT request to `/beneficiaries/update/{id}` which modifies a record and clears the cache.
